ABSTRACT

An application monitoring system is provided. The application monitoring system includes a monitor component to monitor statistics related to an application in operation. A reporting component is in communication with the monitor component and is operable to capture the statistics of the application in operation monitored by the monitor component. A trigger component analyzes the statistics of the application monitored by the monitor component and compares the statistics of the application with a threshold and generates a trigger signal based on the relationship of the statistics of the threshold. A dashboard component is operable to identify the application to monitor and provide an application threshold. A method of monitoring an application using an application monitoring system is also provided.
